Weighing Terminals

User Manual

SAFETY INSTRUCTIONS

CAUTION! READ THIS MANUAL BEFORE OPERATING OR SERVICING THIS EQUIPMENT. FOLLOW THESE INSTRUCTIONS CAREFULLY. SAVE THIS MANUAL FOR FUTURE REFERENCE. DO NOT ALLOW UNTRAINED PERSONNEL TO OPERATE, CLEAN, INSPECT, MAINTAIN, SERVICE, OR TAMPER WITH THIS EQUIPMENT. ALWAYS DISCONNECT THIS EQUIPMENT FROM THE POWER SOURCE BEFORE CLEANING OR PERFORMING MAINTENANCE. CALL BAYKON ENGINEERING FOR PARTS, INFORMATION, AND SERVICE.

WARNING! ONLY PERMIT QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM.

WARNING! FOR CONTINUED PROTECTION AGAINST SHOCK HAZARD CONNECT TO PROPERLY GROUNDED OUTLET ONLY. DO NOT REMOVE THE GROUND PRONG.

WARNING! DISCONNECT ALL POWER TO THIS UNIT BEFORE REMOVING ANY CONNECTION, OPENING THE ENCLOSURE OR SERVICING.

WARNING! BEFORE CONNECTING/DISCONNECTING ANY INTERNAL ELECTRONIC COMPONENTS OR INTERCONNECTING WIRING BETWEEN ELECTRONIC EQUIPMENT ALWAYS REMOVE POWER AND WAIT AT LEAST THIRTY (30) SECONDS BEFORE ANY CONNECTIONS OR DISCONNECTIONS ARE MADE. FAILURE TO OBSERVE THESE PRECAUTIONS COULD RESULT IN DAMAGE TO OR DESTRUCTION OF THE EQUIPMENT OR BODILY HARM.

CAUTION! OBSERVE PRECAUTIONS FOR HANDLING ELECTROSTATIC SENSITIVE DEVICES.

RIGHTS AND LIABILITIES

Contents:

1. KEY FEATURES

2. The Front View and Key Functions

Figure 2-1 - Front panel view of BX10

2.1 Display

The weight display of BX10 is seven segments LED. At the right side of the display there are three LED's for indicating the net, gross and the unit (standard kg). The meanings of the announcement LED's on the display are:

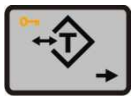
Gross	Announces the indicated value is the gross weight.
Net	Announces the indicated value is the net weight.
→0←	Announces the weight is in the center of zero.
~	Announces the weight value on the display is unstable.
Units	g, kg, t, lb, klb, N, kN units are located on the right of the display.

2.2 Key Pad

The keys and the key functions of BX10 are:

Function: Key function is programmable to Increased Indication, Total, Tare value indication, CN value indication,

GN / Set Point : Pressing this key indicates the Gross weight temporarily. Press long time to jump the parameters of Digital I/O port.



Tare / Clear: Pressing this key tares the scale and get into the Net mode. Press long time to clear the tare.

Zeroing: In Gross mode, if the scale doesn't show zero while there is no load on the pan, you can zero the scale by pressing this key.

Print: By pressing this key weight data and other information depending on the setup parameters sent to a printer or a PC via serial port.

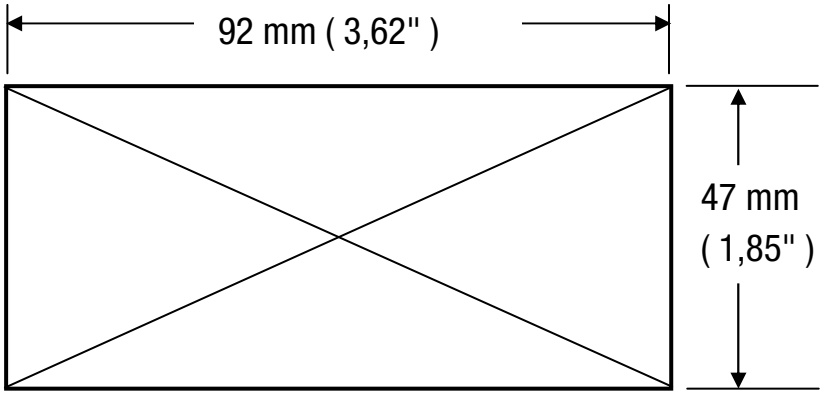
2.3 Key Lock

BX10 has ability to lock the keys to avoid unauthorized person's interfere. The key(s) which would be locked are programmed at parameter [**115**].

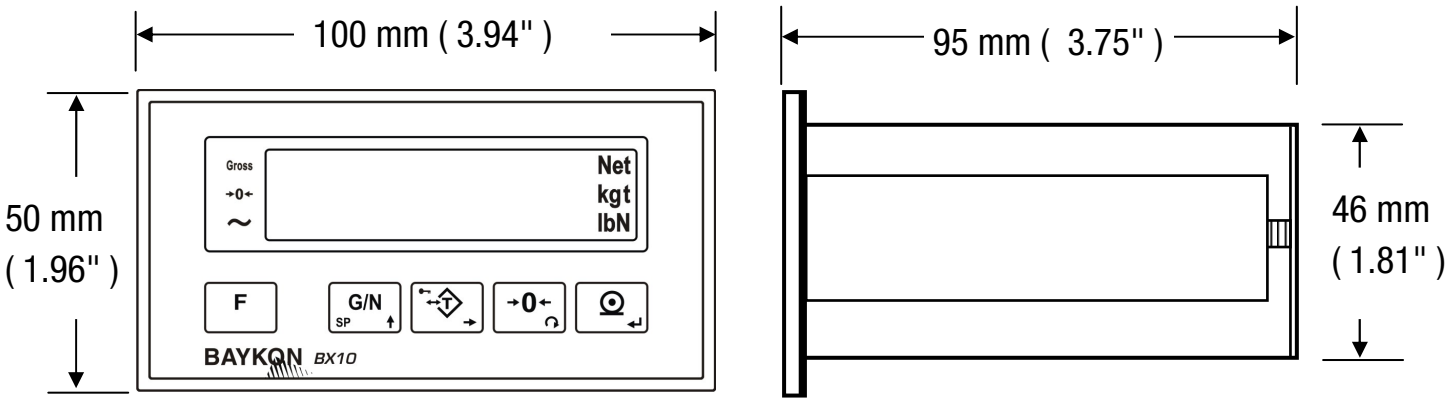
You can activate or deactivate this function by long pressing <**F**> key, press <**Tare/Clear**> and <**Print**> keys sequentially. [**Lock**] prompt appear for a short while to indicate the pressed key is locked.

2.4 Housing

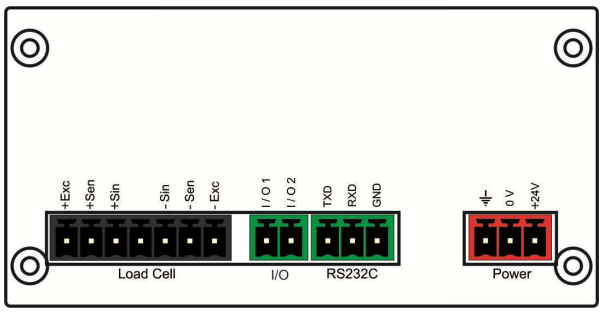
BX10 housings are panel type with plastic front and stainless steel back parts, and aluminum body.



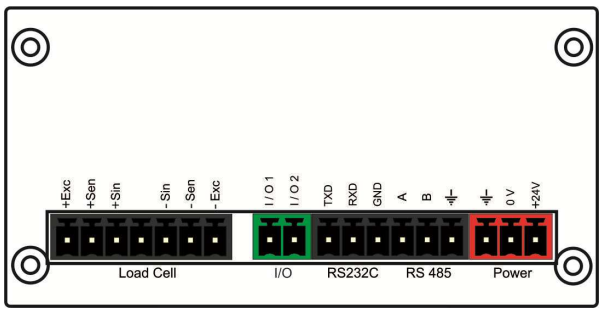
The hole dimensions for mounting BX10 on the panel



BX10 front and side view



BX10 Panel type rear view



BX10 MB Panel type rear view

2.5 Accessories supplied with the instrument

The following accessories are supplied together with the BX10 instruments. If any part is missed, please contact to your supplier.

	BX10	BX10 MB
3-pos and 3,81 mm pitch red plug for power supply and green plug for RS 232C	2	1
7-pos and 3,81 mm pitch black plug for load cell cable	1	1
6-pos and 3,81 mm pitch black plug for RS 232C&RS 485	-	1
2-pos and 3,81 mm pitch green plug for I/O	1	1
Installation CD (IndFace1X setup, user manual and technical documents)	1	1

Table 2.1 - Accessories supplied with instrument

2.6 Accessories sold separately

The following accessories can be supplied from BAYKON.

	BX10	BX10 MB
Sealing kit for approved scales	√	√
RS-232C cable for PC connection (3 meter)	√	√
Junction box for load cell connection	Refer to junction box catalog	
Open end load cell cable 6 wire (0.22 cm^2 each)	Maximum 200 meter length	

Table 2.2 - Accessories supplied separately

3. OPERATION

3.1 Basic Weighing

Zeroing

Zeroing corrects the drifts of the unloaded scale from the zero point. Zeroing range is limited in the instrument in set up mode. Refer to technical manual for details on zeroing limits.

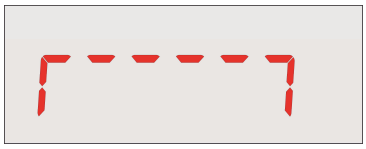
1. Unload the scale.
2. Press **< Zero >** key.
3. Centre of zero appears **›0‹** symbol on the display.
4. Check the center of zero sign on the left of the display. If it is not appears, press **< Zero >** key once more for correct zeroing.

Weighing

1. Press **< Zero >** key, if [0.00 kg] is not displayed at unloaded scale.
2. Place weighing item on the scale.
3. Wait until the motion annunciator ~ disappears from the display.
4. Read the weighing result.

If the loading is out of the indication range the prompts below are displayed.

Under of negative indication limit



Over than positive indication limit

Net weighing in the container

Taring is used to weight material in the container at basic weighing operation.

1. Place the empty container on to the scale and press **<Tare>** key.
2. The display is zeroed and the **NET** symbol appears. Check **›0‹** sign on the display. If it is not appears, press the **<Tare>** key once more for correct taring.
3. Add the material into the container and follow its weight in net.

Clearing the tare

Long press **<Tare>** key in net mode. The **NET** symbol disappears and Gross symbol appears on the display together with the gross weight indication.

Automatic clear

The tare is automatically cleared after emptying the scale, if this feature is enabled. Refer to parameter [**113**].

Automatic zero point correction

Zero point is corrected automatically for minor deviations if the change is within the range of limited zeroing range value. Disable this correction at the applications like tank weighing, batching, filling

etc. against wrong zeroing at feeding. Refer to Automatic Zero Tracking parameter [**214**].
Automatic zero point correction range is limited together with zeroing range above.

Automatic zero at power on

Warning: Automatic zeroing at power on can be enabled only if the scale is always unloaded before power on. This function should be disabled at tank / silo weighing applications.

Zero point is corrected automatically at power on the instrument to compensate zero drifts of the scale if the scale is always power on when unloaded. This feature should be disabled for tank, silo, hopper scales etc.

Power on zero has a limited range and the instrument announces [**E E E**] error prompt in case of out of range. Press **< F >** key to read the residual drift and to start indication without zeroing and call service.

Restore Tare at Power on

This function saves the tare at power off and the instrument start to operate Net after power on as before power off. This feature should be enabled, if taring is used at tank weighing applications. Refer to parameter [**112**].

Printing

Press **< Print >** key when the item is on the pan and weight is stable to print the label. Refer to *Page 25* for details.

Force measurement

The instrument should be set to force mode for the bidirectional force measurement from –Maximum to +Maximum. The force unit N or kN can be displayed. BX10 is very fast force measurement instrument with its high conversion rate, up to 1600. Refer to parameter [**210**].

High resolution (Default)

If you program **< F >** key for high resolution, the weight value is displayed 10 times higher resolution temporary 5 seconds.

Temporary Gross indication in Net

Pressing **< G/N >** key indicates the Gross weight temporarily for 5 seconds in Net mode.

Total

If you program **< F >** key for totalization, the printed weights are accumulated and displayed by pressing **< F >** key. Press **< Print >** key to transfer total or press **< Zero >** key to erase the total while the total is displaying.

4. INSTALLATION

PRECAUTION: *Please read this section carefully before installation of the instrument. Applying the recommendations in this section will increase your system reliability and long term performance.*

4.1 Recommendations

Control Cabinet Design

Warning: *Please care the following warnings for designing the control cabinet which will increase your system reliability.*

The control cabinet should be designed so that Analog Digitizer can operate safely. The panel should be placed clean area, not getting direct sun light if possible, with a temperature between -15 ºC and +55 ºC, humidity not exceeding 85% non-condensing. All external cables should be installed safely to avoid mechanical damages.

BX10 instruments are very low level signal measuring instruments. To avoid electrical noise, BX10 should be separated from the equipments that produce electrical noise. Preferable use metal cabinet against radio frequency interference and the cabinet shall be connected to ground against the electromagnetic disturbances. Load cell cable trays must be separated from others, if possible. If there are noise-generating equipments such as heavy load switches, motor control equipments, inductive loads etc. please be careful against the EMC interference in the cabinet. If possible protect BX10 instruments with the faraday cage or install them in separate section or install them far a way from this kind of equipments. Connect parallel reverse diodes to the DC inductive loads like relays, solenoids etc. to minimize voltage peaks on the DC power lines.

Cabling

All cables coming to the control cabinet shall be shielded. Please use separate cable tray for these low signal level cables. Distance from load cell cables, interface cables and DC power supply cables to power line cables shall be minimum 50 cm.

Warning: *Please always remember that BX10 instruments are very low voltage measuring instruments. Your control cabinet design and proper installation increases reliability and performance of the instrument. Please do not forget that the instrument must be powered off before inserting or removing any peripheral connector.*

4.2 How to install the instrument and Scale ?

Please folow the installation and commissioning steps described below carefully to prevent unwanted results after installation.

Step 1. Mechanical installation

Take care to the housing dimensions and the suggested panel hole dimensions given in the *Page 4*. Install the indicator on the panel with its panel fixing accessories. Be sure, all mechanical installation of your mechanical system and panel are finalizing before starting the next step.

Step 2. Load Cell connection

Warning: *After load cell connection to the instrument, the welding on the mechanical constriction is not recommended. Disconnect all connectors from indicator before welding on the mechanical hardware.*

Load cell connection detail is shown in Figure 4-1. In 4-wire installations the sense and excitation pins with the same polarity **should be short circuited** at the connector side. If you have junction box, use 6 wire cable between BX10 and the junction box, and short circuit these pins at junction box for better performance.

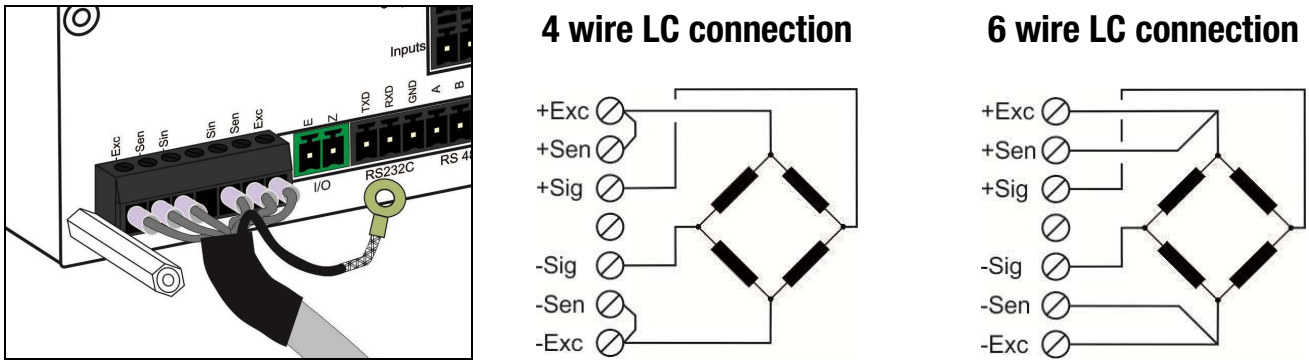


Figure 4-1 - Load cell connections

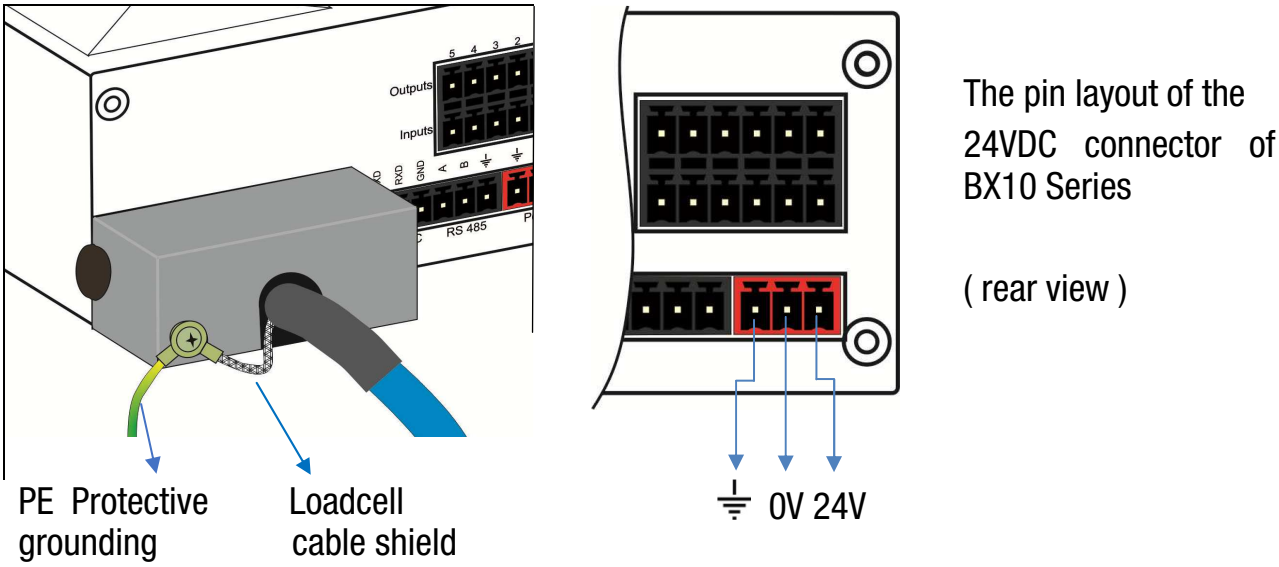
Warning: *Always connect Sense pins to Excitation pins for 4 wire connection. Non-connected sense pins may cause the wrong Excitation voltage measurement and create an accuracy problem.*

Warning: *Connect the load cell cable shield to the reference ground or shield pin of the load cell connector.*

Step 3. Power supply connection and grounding

The quality of the instrument's ground will determine the accuracy and the safety of your measuring system. A proper ground connection is needed to minimize extraneous electrical noise affects on the measurement. A poor ground can result in an unsafe and unstable operation. It is important that the instrument should not share power lines with noise-generating parts such as heavy load switching relays, motor control equipments, inductive loads, etc. If the condition of the power line in the plant is poor, prepare a special power line and grounding.

Power supply voltage of the instrument shall be between 12 VDC and 28 VDC. The pin configuration of the 24 VDC power supply connector located right - bottom of the instrument is shown in Figure 4-2 below. Be sure, the power supply is switched of before connection.



The pin layout of the 24VDC connector of BX10 Series

(rear view)

Figure 4-2 - The pin layout of 24VDC connector

Warning: *Before interfering the instrument, turn off the power and wait at least for 30 seconds.*

Warning: *Connect the grounding ⏚ pin to the reference ground.*

Step 4. Energize the instrument

Check the mechanical installation, grounding, load cell connection and power supply connection to be sure the correct electrical installation before energizing the instrument. If before steps are done properly energize the instrument.

Step 5. Set the calibration switch to programming and calibration

Warning **:** *If the scale is sealed before, call the authorized person before interfaring the scale.*

If there is a DIP switch on BX10's rear side and its position should be "ON" (downward) to change the metrological related parameters including calibration. No need to open the housing to change the position of this DIP switch.

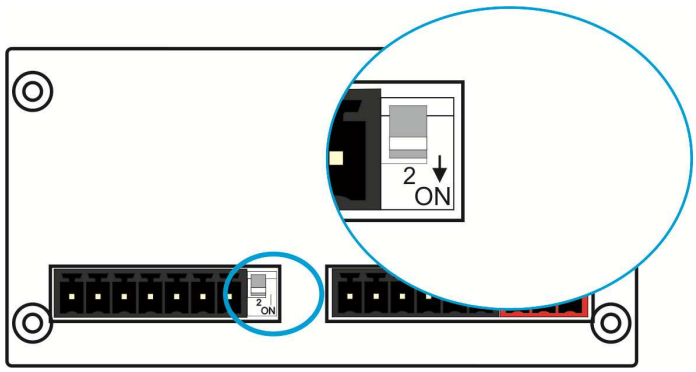


Figure 4-3 - The location of calibration DIP switch

Step 6. Programming

You will program the instrument according to your application in this step. Adjust;

- Interface parameters in block [**0--**] RS232 and RS485 serial ports,
- Configuration parameters in block [**1--**] for scale functions related with application like saving tare before power off and restart in Net mode and digital I/O related entries.
- Set up parameters to set up the scale in block [**2--**] like zeroing range. Please remember these parameter values are restricted for scale usage in trade. You have to enter the scale capacity and devision values in this block.

Warning: *The programming and parameter descriptions are referred in Page 15. We recommend you to save these parameters before next step against to lost the adjustments in this step if calibration can not performed somehow.*

Step 7. Calibration

You will calibrate the scale after programming the parameters. You may follow one the calibration methods below.

- eCal Electronic calibration without test weight need via IndFace1x. Refer to *Page 18*.
- Full calibration via keys on the instrument by using test weight. Refer to *Page 18*.
- Zero adjustment and span adjustment in sequence via keys. Span calibration is needed test weight.You may save the zero adjustment before starting span adjustment. Refer to *Page 20*.
- Span adjustment under load in sequence via keys if the scale cannot be emptied when the span adjustment is performed. Need test weight for span calibration. Refer to *Page 21*.

You may access to the calibration menu from operation menu by following the description in fast access to the calibration section (*Page 20*). After the calibration go back to the operation menu after saving adjustment (Refer to *Page 15*)

Remember: *You may use parameter 905 to follow the load cell output voltage on loading, if you can not perform the calibration.*

Step 8. Testing the scale performance

You have to check your scale performance by testing the scale eccentricity, scale linearity at loading until maximum loading value and unloading, repeatability etc. before using it. If testing results are not in your limits recheck the steps above and your hardware to find the error source.

Step 9. Bring the DIP switch to up position to unlock the scale adjustment

If the DIP switch is bring to the downward position for programming, push it to the upward position to lock the scale adjustment against interfaring the un-autorized persons in to the scale. If the scale is used in non-trade industrial weighing, this step is not must.

Warning: *If the scale is used in trade, the scale should be sealed after bringing the DIP switch to the upward position sealed before. Call the authorized person for sealing the scale, if need be.*

Step 10. Peripheral related parameters programming, if any

If you will connect any peripheral to the instrument, you have to set the related parameters up. Refer to *Page 12* for digital input/output.

Step 11. Peripheral connections

If you will make any peripheral connection like digital input, digital output, RS232 and RS485 etc. switched off the power supply and connect you peripheral as described below and in the related section of this manual. You will find detailed description on the peripheral connection and interfacing details in the BX10 Technical Manual.

Important : *Powered off the instrument before any connector installing to the instrument.*

Digital Input Connection

If the port is programmed as a digital input, they can be programmed for Taring/Clear or for Zeroing. Inputs are non-isolated, common ground, 12 to 28 VDC and 10 mA.

Digital inputs connection diagram is shown in Figure 4-4.

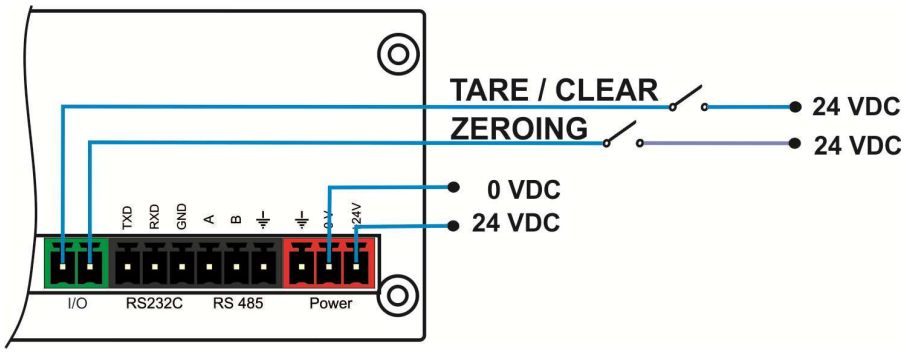

Figure 4-4 - BX10 Inputs connection diagram

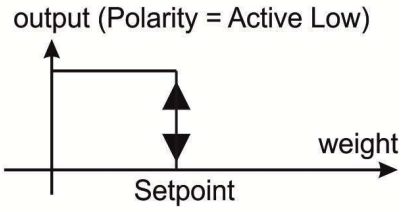
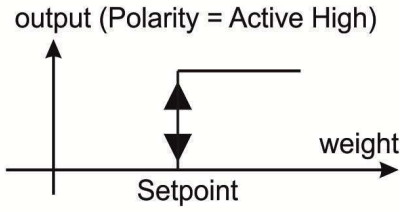
Digital Output Connection

If the port is programmed as a digital output, it operates as a free setpoint. Output ports are common ground, non-isolated transistor output, 28 VDC and 100mA.

The polarity of setpoint outputs can be programmed as active low or as active high by parameter [**137**]. The output status changes if the weight value is equal and bigger than setpoint value entered to par. [**138**] and par [**139**].





Digital outputs connection diagram is shown in Figure 4-5.

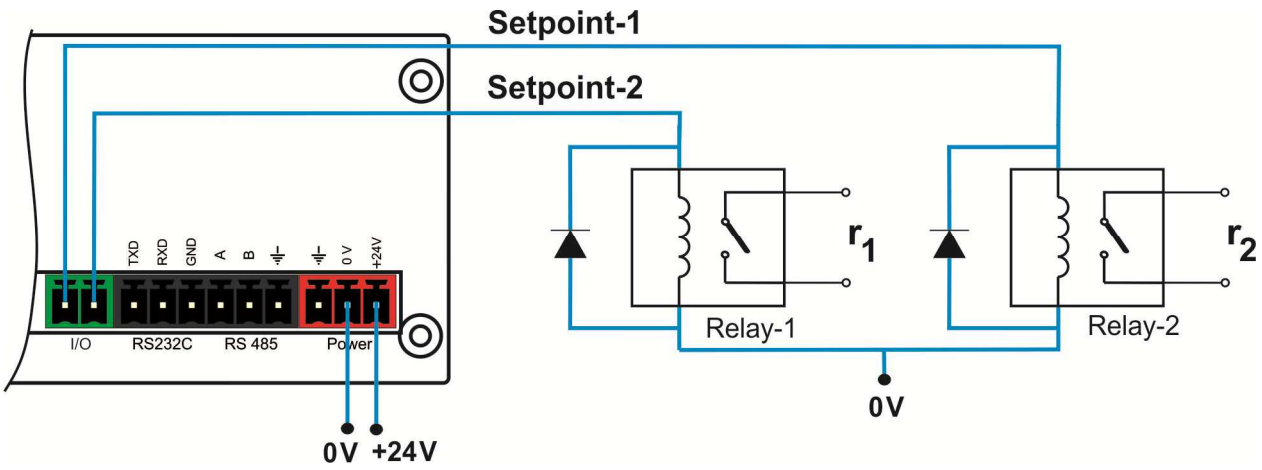


Figure 4-5 - BX10 Outputs connection diagram

RS 232C Connection

RS 232C port usage and specifications are shown in the table below.

Usage	Interfacing with PC or PLC, remote display connection, programming via IndFace1X
Data formats	Continuous, Fast Continuous, Printer Format, BSI Protocol, Modbus-RTU High-Low, Modbus-RTU Low-High (*Parameter* [**000**])
Baud rate	1200 / 2400 / 4800 / 9600 (Default) / 19200 / 38400 / 57600 / 115200 bps (*Parameter* [**001**])
Length and parity	8 bit no parity (Default), 7 bit odd, 7 bit even, 8 bit odd, 8 bit even (*Parameter* [**004**])
Start/ Stop bits	1 start bit and 1 stop bit

RS 232C serial connection is done with three wire as indicated below in Figure 4-6.

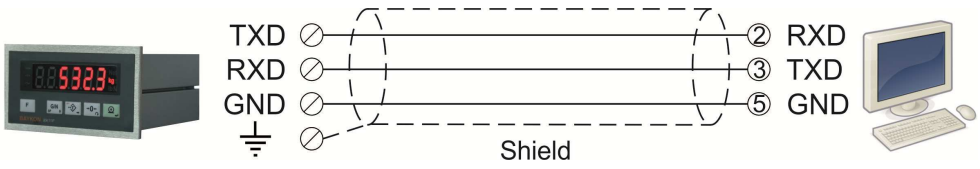

Figure 4-6 - RS 232C serial interface connections

Warning: *Connecting the shield to the reference ground will protect your weighing system against EMC disturbances.*

RS 485 and Modbus-RTU Connection (Only BX10 MB)

RS 485 port usage and specifications are shown in the table below.

Usage	Interfacing with PC or PLC, remote display connection, programming via IndFace1X,
Data formats	Continuous, Fast Continuous, Printer Format, BSI Protocol, Modbus-RTU High-Low, Modbus-RTU Low-High (*Parameter* [**010**])
Baud rate	1200 / 2400 / 4800 / 9600 (Default) / 19200 / 38400 / 57600 / 115200 bps (*Parameter* [**011**])
Length and parity	8 bit no parity (Default), 7 bit odd, 7 bit even, 8 bit odd, 8 bit even (*Parameter* [**014**])
Start / Stop bits	1 start bit and 1 stop bit

RS 485 serial connection is done with three wire as indicated below in Figure 4-7. Line termination resistors (110 ohm) are needed both ends of the RS 485 line.

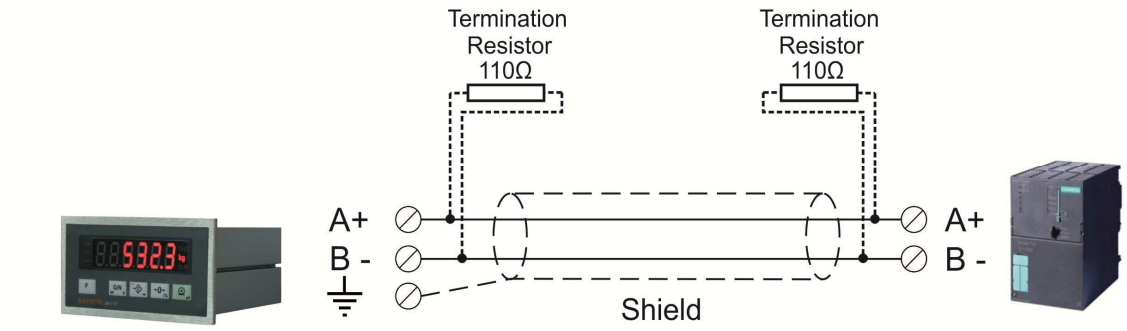

Figure 4-7 - RS485 serial interface connections

Warning: *Connect the shield to the reference ground.*

Step 12. Peripheral connections testing

Test your peripheral connections. You may change the related parameters in your testing for better performance, if need be.

You may use also main parameter group [**9--**] for RS232, RS485, and digital In / Out testing.

5. PROGRAMMING AND CALIBRATION

The signs those take place on the lower right corner of the keys indicate the function of the keys in programming menu. The basic meanings of these keys are given the table below.

				• Return to main block • Exit without saving	Advancing next parameter	Select the digit will be changed	Changing parameter value or increasing the blanking digit	• Go to the next parameter • Enter • Save and Exit

5.1 Entering the Programming and Calibration

Follow the steps below to enter programming and calibration menus.

Display	Operation
[**123.456** kg]	Press  key until [**PASSWr**] prompts seen.
[**PASSWr**]	Press  keys sequentially.
[**---**]	Press  key for confirm.
[**0--**]	First block of Programming menu.

Programming and Calibration menu consist of main blocks which are shown as [**X--**] and sub-blocks. By using < ↑ > key you can reach next main blocks. After reaching the desired main block, you can get in by pressing < **Enter** > key. As you enter the block you will reach the first sub-block in that main block. The sub-block address will be seen on the display as [**X0-**]. You can also search between the sub-blocks by using < ↑ > key and reach the first parameter of the sub-block seen on the display by pressing < **Enter** > key. The number of the parameter comes on display as [**XY0**]. Again you can search between parameters by < ↑ > key. For entering numerical value in the parameters, press the < **Tare** > key to select the digit and press the < **Zero** > key the change the value.

You may adjust your parameters and calibrate the scale by using the diagram below:

5.2 Exiting the Programming and Calibration

If you press < **F** > key sequentially at any parameter, you reach the next up level blocks the [**SAvE**] message appears after main block. Press < **Enter** > key to save, or you can press < **Tare** > key to store the changes until the power goes off, or you can press < **F** > key to abort changes. [**Wait**] message will be seen on the display for a little while, and automatically go back to the weighing operation.

Changeable with calibration DIP switch.

Calibration with test load:

Access to the parameter 301 and follow the steps below to calibrate the scale.

1. Press < **Enter** > at the [**301**] prompt to start the calibration.
2. At the [**ZEro.CA**] prompt, remove any weight on the platform, then press < **Enter** >.
3. The terminal automatically starts to capture zero and the [**WAıt**] message indicating the operation is in progress.
4. After the [**Load**] prompt, the test weight value will be used for the calibration seen on the display as [**XXXXXX**] . If the value of the test weights that will be used is different from the value shown on the display, type the new value via < **Tare** > and < **Zero** > keys. A minimum of 20% of scale capacity is necessary for calibration; BAYKON recommends 50 to 100%. A calibration error is produced if insufficient weight is used.
5. Place the test weights or another practical weight on the scale.
6. Press < **Enter** > to start span calibration. [**WAıt**] message will shown on the display 10 seconds while span calibration is performed.
7. The following parameter is displayed after calibration. If any, error message is announced. (*Page 28*)

Note: *Refer to Technical manual for multipoint calibration to correct the linearity.*

eCal Electronic Calibration without test load:

Warning: *The scale capacity and increment shall be entered before performing eCal.*

This parameter lets you to perform calibration without using any test weights. BX10 A/D coefficients are adjusted in production for increasing eCal accuracy. The calibration coefficients are calculated by scale capacity, total load cell capacity, load cell full scale output, and estimated dead load.

Access to the parameter 313 and enter the values below as;

[LC.CAP]

[XXXXXX]

Enter total load cell capacity via < **Tare** > and < **Zero** > keys and press < **Enter** > key to go to the next step.

Example : If the weighing system has 4 pcs 1000 kg load cell, enter 4000.

[LC.oUt]

[XXXXXX]

Enter load cell output in mV/V via < **Tare** > and < **Zero** > keys. If the weighing system has more than one load cell, calculate the mean value of load cells outputs mV/V indicated on the certificates of the load cells. Press < **Enter** > key to go to the next step.

Example: If load cell outputs are LC1: 2.0010, LC2: 1.9998, LC3:1.9986 and LC4:2.0002, the mean value will be

Mean of LC outputs = (2.0010 + 1.9998 + 1.9986 + 2.0002) ÷ 4 = 1.9999 mV/V.

[ZEr.AdJ]

[XXXXXX]

If the scale is empty and you want to make automatic zero adjustment instead of entering estimated dead load (look next step), press < **Enter** > key appears [**Zero.CA**] and press < **Enter** > key for starting zero calibration. The display will show [**WAıt**] message during zero adjustment. In this while the scale must be unloaded and stable. Approximately 10 seconds later eCal calibration is performed.

If the scale is not empty or you prefer to enter estimated preload value, press the < **G/N** > key.

[PrE-Ld]

[XXXXXX]

Enter the dead load value of the weighing system in current unit by using < **Tare** > and < **Zero** > keys. Press the < **Enter** > key to go to the next step.

***Note**: If you want to make zero adjustment after entering estimated preload value, empty the scale, change the preload value as (estimated value + display value at empty scale) or enter parameter [**310**] for zero adjustment.*

5.3 Fast Access to the Calibration

The instrument has fast access calibration feature to earn time to the service technician. If only the calibration adjustment is needed, follow the steps below to access the calibration parameters fast.

Display	Operation
[**123.456** kg]	Press F key until [**PASSWr**] prompts seen.
[**PASSWr**]	Press →0← + →0← + →0← keys sequentially.
[**---**]	Press ⊙↵ key for confirm.
[**310**]	Zero Adjustment parameter.
"Calibration"	Press ⊙↵ key to start zero adjustment. Or press G/N SP ↑ key to access span calibration without zero adjustment.

[31-] Adjustment

In this sub-block you can only perform zero adjustment or span adjustment without full calibration operation.

[310] Zero Adjustment

This parameter is only being used for refreshing the zero level of the scale to prevent wrong weightings from zero drifts.

1. Press < **Enter** > at the [**310**] prompt to start the zero adjustment.
2. At the [**ZEro.CA**] prompt, remove any weight on the platform, then press < **Enter** >.
3. The terminal automatically starts to capture zero and the [**WAıt**] message will shown on the display 10 seconds while zero calibration is performed.
4. The following parameter is displayed after calibration. If any, error message is announced. (*Page 28*)

[311] Span Adjustment

This parameter lets you to perform span adjustment.

1. Press < **Enter** > at the [**311**] prompt to start the span adjustment.
2. At the [**XXXXXX**] prompt, the test weight value will be used for the calibration seen on the display. If the value of the test weights that will be used is different from the value shown on the display, type the new value via tare and zero keys. A minimum of 20% of scale capacity is necessary for calibration; BAYKON recommends 50 to 100%. A calibration error is produced if insufficient weight is used.

3. Place the test weights or another practical weight on the scale.
4. Press < **Enter** > to start span calibration. [**WAıt**] message will shown on the display 10 seconds while span calibration is performed.
5. The following parameter is displayed after calibration. If any, error message is announced. (*Page 28*)

[312] Span Adjustment Under Load

This parameter is being used to perform span adjustment of a scale without lifting the load on it. This operation especially used for span adjustment for filled tanks. You can make span adjustment without emptying the tank.

1. Press < **Enter** > at the [**312**] prompt to start the span adjustment under load.
2. [**P.ZEro**] prompt appears on the display to indicate the scale load will be determined as temporary zero.
3. Press < **Enter** > key and the display will show [**WAıt**] message during temporary zero adjustment.
4. At the [**LoAd**] a little while and then [**XXXXXX**] prompt, the test weight value will be used for the calibration seen on the display. If the value of the test weights that will be used is different from the value shown on the display, type the new value via < **Tare** > and < **Zero** > keys.
5. Place the test weights or another practical weight on the scale.
6. Press < **Enter** > to start span calibration. [**WAıt**] message will shown on the display 10 seconds while span calibration is performed.
7. The following parameter is displayed after calibration. If any, error message is announced. (*Page 28*)

[12-] Filter Parameter

In this block the proper filter values according to the operating conditions can be entered. One of the most important features of BX series is viewing filter characteristic on the display and with the help of this option, you can select the most suitable filter without exiting the programming mode.

[120 7] Filter

The filter value can be selected from 1 (fastest) to 9 (slowest). Recommended minimum value of the filter is 7 at common weighing applications. As you enter this parameter and press < **Enter** > key while [**120 X**] seen on the display, the weight variation can be seen on the display. The value of the filter can be changed by using < ↑ > key and the weight variation for every value can be seen on the display. After finishing the filter selection you can go to next step by pressing the < **F** > key.

[13-] Digital I/O

BX10 instrument has 2 digital I/O port which are independently programmed as an input or output.

[137 1] Output Polarity

This parameter is determined the polarity of setpoint outputs.

0 : Active Low 1 : Active High

[138] Digital I/O port 1

[XXXXXX]
If this value is smaller than 999999, the port will be output and the entered value will be the cut off value (setpoint). If the entry is 999999, the port function will be Tare/Clear input.
Default is “000000”.

[139] Digital I/O port 2

[XXXXXX]
If this value is smaller than 999999, the port will be output and the entry value will be the cut off value (setpoint). If the entry is 999999, the port function will be Zeroing input.
Default is “000000”.

Diagnostics

The tests and measurings below are available to find the error source.

RS 232C Serial Interface testing

Short circuit the RXD and TXD pins of the RS232 serial port. Access to the parameter [**901**]. The characters in the alphabet will be seen double on the display by pressing < **Zero** > key sequentily.

RS 485 Serial Interface testing

Access to the parameter [**902**].The characters in the alphabet will sequentially be transferred from RS 485 serial interface port by pressing < **Zero** > key one after another. Received numerical data is also seen on display.

Parallel Inputs

Access to the parameter [**903**]. The prompt [**I X Y**] appears on the display.
To perform parallel input test, enter the number of parallel input to Y digits via < **Zero** > key. X shows the logical condition of that input.

Parallel Outputs

Access to the parameter [**904**]. The prompt [**o X Y**] appears on the display.

To perform parallel output test, enter the number of parallel output to Y digits via < **Zero** > key. To change the logical condition of that output via < **Tare** > key and X shows the logical condition of that output.

Load cell output level in mV

Measuring load cell signal value is very difficult after installation the system. You can measure the load cell signal value at parameter [**905**] without disconnecting the load cell connector.

6. RS232C AND RS485 DATA OUTPUTS

In this section, you will find the data structure of different type of the data outputs via these serial ports.

6.1 Continuous Data Output

Continuous data output of the instrument is transmitted in the following data structure. The serial ports of BX10 are suitable for bi-directional communication. If, you transmit ASCII codes of P(print), Z(zero), T(tare) or C(clear) letters to the serial port of BX10; the indicator will act like the related keys are pressed. Details are in the technical manual. The data format is;

	Status			Indicated						Tare								
STX	STA	STB	STC	D5	D4	D3	D2	D1	D0	D5	D4	D3	D2	D1	D0	CR	LF	CHK

The including of the status bytes STA, STB and STC are ;

Definition Table for Status A (STA)									
Bits 0, 1 and 2				Bits 3 and 4			Bit 5	Bit 6	Bit 7
0	1	2	Decimal point	3	4	Increment size	Always 1	Always 1	X
0	0	0	XXXX00	1	0	X 1			
1	0	0	XXXXX0	0	1	X 2			
0	1	0	XXXXXX	1	1	X 5			
1	1	0	XXXXX.X						
0	0	1	XXXX.XX						
1	0	1	XXX.XXX						
0	1	1	XX.XXXX						
1	1	1	X.XXXXX						

Definition Table for Status B (STB)		
Bit 0	0 = Gross	1 = Net
Bit 1	0 = Weight positive	1 = Weight negative
Bit 2	0 = No Error	1 = Error
Bit 3	0 = Stable	1 = Unstable
Bit 4	Always = 1	
Bit 5	Always = 1	
Bit 6	0 = Not power on zeroed	1 = Zeroed with power on zero
Bit 7	x	

Definition Table for Status C (STC)		
Bit 0	Always 0	
Bit 1	Always 0	
Bit 2	Always 0	
Bit 3	Always 0	
Bit 4	Always 1	
Bit 5	Always 1	
Bit 6	Always 0	
Bit 7	x	

CHK (Checksum) = 0 – (STX + STATUS A + ... + LF)

Error Messages: UNDER, OVER, A.OUT, L-VOLT, H-VOLT, are represented in Indicated data fields.

Note: *The weight data is represented with right aligned, error messages are represented with left aligned.*

Important : *The CR and LF shall be enabled for Baykon remote display interfacing.*

6.2 Fast Continuous Data Output

Fast continuous "indicated weight" data output can be used only for the instruments which can communicate fast. The output rate is related with the baud rate. Use higher baud rate for faster data rate. Received ASCII codes of P(print), Z(zero), T(tare) or C(clear) letters, the indicator will act like the related keys are pressed. CR and LF can be enabled in the related parameter.

The data format of the fast continuous data output is;

[STX][STATUS][SIGN][WEIGHT VALUE][CR][LF]

Examples :

☻S+000123.4	(weight is stable and 123.4)
☻D+000123.4	(weight is dynamic and 123.4)
☻+	(Over load)
☻-	(Under load)
☻O	(ADC out error

6.3 Print Mode

The format of the data output in Print mode can be selected in 3 different type forms in the parameter group [**04-**] . Only continuous format is available more than one interface.

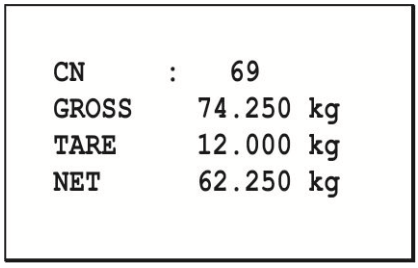
Single Line

You can send the data in single line like below by pressing < **Enter** > key as;

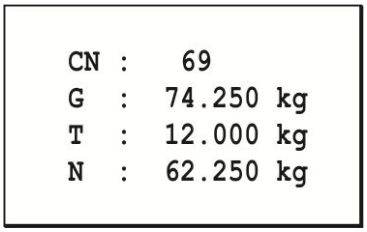
```
CN:    21   G:    3.000kg   T:    1.000kg   N:    2.000kg
```

Multi Line

You can send the data in multiple lines as seen in the label given below by pressing < **Enter** > key. The data output structure can be programmed with printer parameters.



Multi Line-1



Multi Line-2

6.4 BSI Data Structure

BSI data format gives the reliable and speedy interface advantages with communicating PLC or PC for process control or transactional applications. This interfacing is recommended especially at PC interfacing. Details can be seen in the technical manual.

Command Table:

A	Read all weight data immediately
B	Read Gross weight value immediately
C	Clear the tare memory
F	Start /stop continuous data output
G	Read voltage value of DC power supply
I	Read current weight (indicated) value immediately
P	Print: Read the current stable weight value
Q	Load set points
R	Read set points
S	Read Status
T	Tare
U	Read digital inputs
V	Read digital outputs
X	Read current weight value in increased resolution immediately
Z	Zero

7. TECHNICAL SPECIFICATIONS

Common Specifications	
A/D Converter:	
A/D converter type:	24 bit Delta-Sigma ratiometric with integral analog and digital filters
Conversion rate:	Up to 1600 measurement values per second
Input sensitivity:	0.4 µV/d (Approved); 0.1 µV/d (Non approved)
Analog input range:	0 mV to +18 mV (unipolar) ; - 18 mV to +18 mV (bipolar)
Internal resolution:	up to 16 000 000
External Resolution:	
Display resolution	up to 10 000 increment (Approved); up to 999 999 increment (Non approved)
Scale Calibration and Functions:	
Calibration:	Calibration is performed with or without test weights (eCal)
Digital filter:	10 steps programmable adaptive filter
Weighing functions:	Taring, zeroing, auto zero tracking, motion detection, auto zero at power up, net indication at power on, increased resolution
Linearity:	
	Within 0.0015% FS, ≤ 2 ppm/°C
Load cells:	
Excitation:	5 VDC max. 125 mA
Number of load cells:	Up to 8 load cells 350 Ω or 18 load cells 1100 Ω in parallel
Connection:	4- or 6-wire technique. Cable length: maximum 1000 m/mm² for 6-wire connection
Communication:	
RS-232:	1200 to 115200 baudrate, 8N1 / 7O1 / 7E1 / 8O1 / 8E1
Response speed:	Up to 4 ms. response delay after read/write commands
Digital I/O Ports:	
	2 ports can be programmed as digital input or digital output, non-isolated.
DC Power supply:	
	12 to 28 VDC max. 300 mA
Environment and Enclosure:	
Operation temp.:	-15 °C to +55 °C; 85% RH max, non-condensing
Enclosure	Panel type, rear panel is stainless steel; Aluminum body.
Protection	Front panel IP65

BX10 MB Modbus-RTU	
Communication:	
RS-485:	1200 to 115200 baudrate, 8N1 / 7O1 / 7E1 / 8O1 / 8E1
Response speed:	Up to 4 ms response delay after read/write commands
Max Stations:	Up to 31 stations per segment

8. TROUBLE SHOOTING

BX10 weighing indicator had been designed as a very reliable and virtually error free instrument. However if there is an error occurs, do not attempt to repair the equipment before understanding what caused the error. Note the problems you have with your instrument and the error messages shown on the display. Then try to solve the problem according to the error table given below.

ERROR CODE	DESCRIBTION	THINGS TO DO
	Weight is too low	- Check the load - Load cell or instrument could be broken.
	Over Load	- Check the load - Load cell or instrument could be broken.
LC Err	Load exceeds the operation range	- Check the load - Check the calibration - Load cell or instrument could be broken.
E E E	Weight is out of power on zero range	- Press F key to start indication without zeroing and call service.
Err 1	ADC error	- Re-energize indicator - Call BAYKON
Err 2	ADC error	
Err 3	Indicator can not be calibrating	- Check load cell cable and load then start calibration again
Err 10	EEPROM error	- Configure the instrument - EEPROM broken
Err 20	Calibration error	- Calibrate the indicator..
Err 21	Configuration error	- Configure the indicator.
Err 22	Tare, CN, Total weight and the SP in use error	- Check SP, PT and ID entries. - Check Tare, CN and Total weight
Err 26	Set point error	- Reload Set points.
Err 27	Indicator is not calibrated	- Calibrate the indicator
Err 30	Processor Error	- Call BAYKON
Err 34	Indicator can not be calibrating	- Load cell signal is negative, very low or too high
Err 35	Calibration Error	- Calibration loading is not enough. - Check test weight loading.
Err 36	Calibration load value entry Error	- Test weight is too small. Increase the test weight.
Err 37	Scale unstable	- Wait until scale become stable. - Check grounding wiring.
Err 47	Main pcb info error	- Call BAYKON
Err 61	Eeprom error	- Call BAYKON
Err 70	Modbus selection error	- Check data format of other interfaces. - Other interfaces should not be Modbus.
E XXXX	Hardware error	- Call BAYKON

9. FREQUENTLY ASKED QUESTIONS

Question	:	My PC could not interface with BX10. How can I check the com port?
Answer	:	– Connect the instrument to the PC and run Hyper Terminal. – Check com ports as described in The Diagnostic Test section on *Page 22.*
Question	:	IndFace1X installation needs restart every time. How can I install it?
Answer	:	– Read and follow the installation notes in the installation directory. – Update your computer (visit http://update.microsoft.com).
Question	:	IndFace1X could not connect to instrument. What can I do?
Answer	:	– Check the power, data cabling and PC port setting. – Remove other connections. Re-energize the BX10 instrument and then make connection.
Question	:	My PC doesn't have any COM port. How can I connect instrument to my PC?
Answer	:	You can use RS-232 / USB converter for serial interfacing via USB port. And select com port with Connection Settings menu.
Question	:	My PC have a COM port but I couldn't see COM port in Connection Setting menu. How can I solve that problem?
Answer	:	Another software may be connected to that COM port. Close all applications before running IndFace1X.
Question	:	My PC could not interface with BX10. How can I check the com ports?
Answer	:	Short circuit your com port RXD and TXD pins. Check if the sending data is received or not by using any terminal software. You may test also BX10 com ports as described in The Diagnostic Tests section on *Page 22* by short circuiting RXD and TXD terminals.
Question	:	I need very fast interfacing. What is the response delay time of BX10?
Answer	:	BX10 response delay is max. 4 milliseconds for weight data. Extremely fast interfacing.
Question	:	What is the external conversion rate of BX10?
Answer	:	Only continuous data output rate might be called as an external conversion rate which is depend on the baud rate and data length and up to 65 conversion/second.

EU Declaration of Conformity

AB Uygunluk Beyanı

BAYKON ENDÜSTRİYEL KONTROL SİSTEMLERİ SAN. VE TİC. A.Ş.

Kimya Sanayicileri Organize Sanayi Bölgesi Organik Cad. No:31
34956 Tepeören Tuzla/İSTANBUL TURKEY

This declaration of conformity is issued under sole responsibility of the manufacturer.

Bu uygunluk beyanı imalatçının sorumluluğu altında düzenlenmiştir.

The object of the declaration described above is in conformity with the relevant Union harmonisation legislation:

Yukarıda belirtilen beyan konusu, ilgili şu AB mevzuatına uygundur:

EU Directive: AB Yönetmelikleri:	**Applicable Standards:** Uygulanabilir Standartlar:
Low Voltage Directive (LVD): (2014/35/EU) Alçak Gerilim Yönetmeliği (LVD): (2014/35/AB)	EN 60950-1:2008 / TS EN 60950-1:2008
Electromagnetic Compatibility (EMC): (2014/30/EU) Elektromanyetik Uyumluluk Yönetmeliği (EMC): (2014/30/AB)	EN 61326-1:2013 / TS EN 61326-1:2013
RoHS Yönetmeliği: (2011/65/EU) RoHS Directive	EN 50581:2012 / TS EN 50581:2013

Important notice for verified weighing instruments in EU countries;

AB ülkelerinde doğrulanan tartı aletleri için önemli not;

M

Weighing instruments verified at the place of manufacture bear the preceding mark on the packing label and the metrology marking on the descriptive plate. They may be put into use immediately.

Üretim yerinde doğrulanan tartı aletleri, ambalajında yandaki işareti ve tanıtım plakasında metroloji işareti taşırlar. Hemen kullanıma alınabilirler.

M

Weighing instruments which are verified in two steps have no metrology marking on the descriptive plate, bear the preceding identification on the packing label. The second step of the verification must be carried out by the Baykon. Please contact to Baykon.

İki aşamalı olarak doğrulanan tartı aletlerinin tanıtım plakasında metroloji işareti yoktur, sadece ambalajında yandaki işareti taşırlar. Doğrulamanın ikinci aşaması Baykon tarafından yerine getirilmelidir. Lütfen Baykon'la bağlantıya geçiniz.

The first step of the verification has been carried out in the manufacturing company. It comprises all tests according EN 45501-8.3.3. If national regulations in individual countries limit the period of validity of the verification, the operator of such a scale is himself responsible for its timely re-verification.

Doğrulamanın birinci aşaması üretici firmada gerçekleştirilmiştir. Bu, TS EN45501-8.3.3 'de yer alan tüm testleri içerir. Eğer tartı aletinin kullanıldığı ülkelerde ulusal hükümler doğrulamanın geçerlilik periyodunu sınırlıyorsa, doğrulamanın yenilenmesi tartı aletininin kullanıcısının sorumluluğundadır.
